Cannot add a PrototypeCell to UITableView inside xib file

I am new in IOS. I want to create a UITableView in a xib file instead of my Main.storyboard.

But the problem is when I drag a UITableViewCell in to UITableView, it does not work like in Main.storyboard.

My Main.storyboard now have many screen so it's very slow when load and also it's hard to find any screen. Therefore, I want to put put UITableView to xib file.

Do I miss something or I make something wrong? Any help would be appreciated

I'm sorry, but prototype cells are available only in storyboard-based projects. Hopefully you won't have gone too far down the xib approach and can try multiple storyboards instead. If you find them a bit overwhelming, it's OK; they get better – note that you don't have to have one storyboard for all your view controllers. You can have several, either linked in code or using

storyboard references.

If you want to stick with xibs, another option is to use <code>registerNib</code> in code. So you design your prototype cells in xibs, then register them in code. Not quite as smooth, but it might suit your needs.

Thank you for your explain. I will try to create prototype cell in xibs - Phan Van Linh Dec 17 '15 at 10:26

Wow, this used to work in Xib, IIRC. They removed this functionality just recently. - Enrico Susatyo Jan 25 '17 at 2:18

Please check out this process. Follow this and you will get a custom cell to table

```
#import "PersonController.h"
#import "CustomCell.h"
@interface PersonController ()
@end
@implementation PersonController
- (void)viewDidLoad {
    [super viewDidLoad];
    // Do any additional setup after
}
```
